

BW Modernization Webinar Series - Session 7

Working with SAP Business Warehouse Elements in SAP Datasphere

Dominik Kurz, SAP

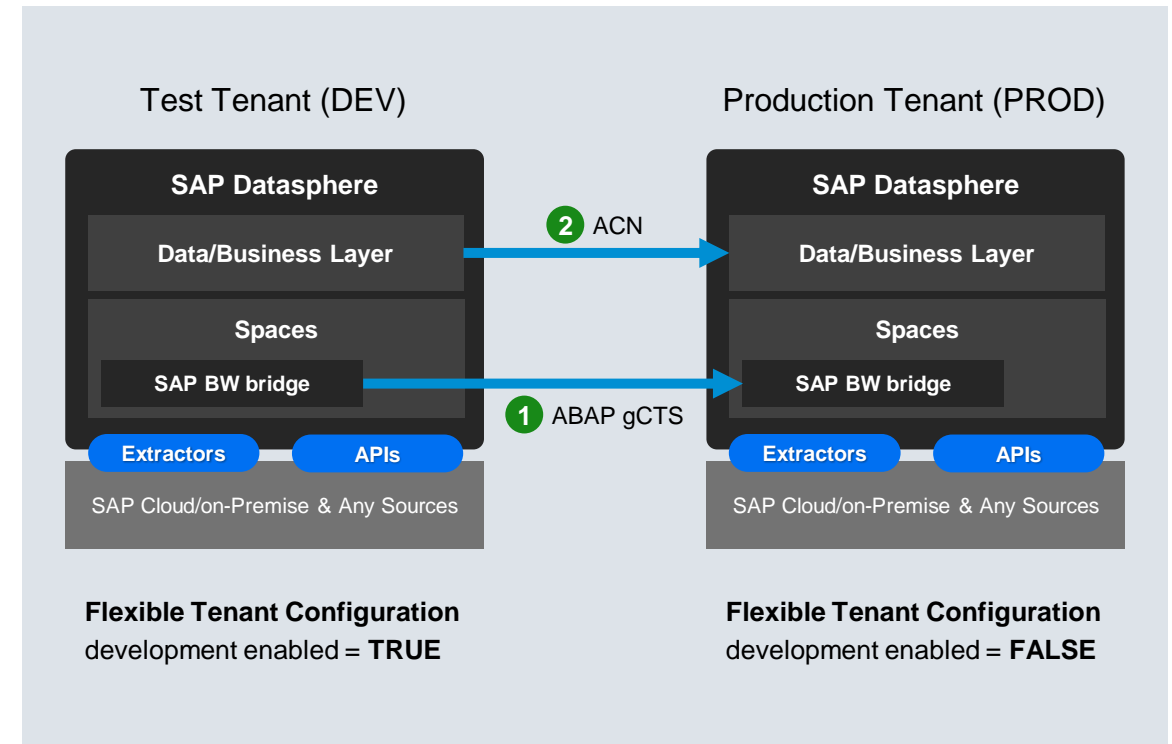

Public

Best practices – Infrastructure, Space concept, naming convention ...

SAP BW bridge: Multi-tier landscape support

- Define your landscape setup **BEFORE** you provision the SAP Datasphere tenants.
Single-tier setups cannot be converted!
- DEV tenant of the SAP BW bridge instance is automatically set to “development enabled = TRUE” ⚠ do not change this!
- PROD tenant of the SAP BW bridge must be configured as “development enabled = FALSE”
- Then you can start transporting from DEV to PROD between the SAP BW bridge instances
- Both transport mechanisms work independently, therefore
 1. transport the SAP BW bridge objects first, expose the data and objects in the SAP BW bridge space. In SAP Datasphere, SAP BW bridge, transports are carried out via gCTS (git-based Change and Transport System, see [SAP Help](#) for details). This is controlled via the software component. Initially, all objects assigned to a software component are transferred to other systems in the system landscape and subsequently a delta mechanism is available in gCTS.
 2. transport the SAP Datasphere objects on top. In SAP Datasphere, transports between tenants are carried out using the transport and CSN/JSON methods. The transports are controlled via the SAP Analytic Content Network (ACN), see [SAP Help](#) for more details.

For more information, see also [SAP Note 3130759](#)

Complexity drivers for SAP BW customers

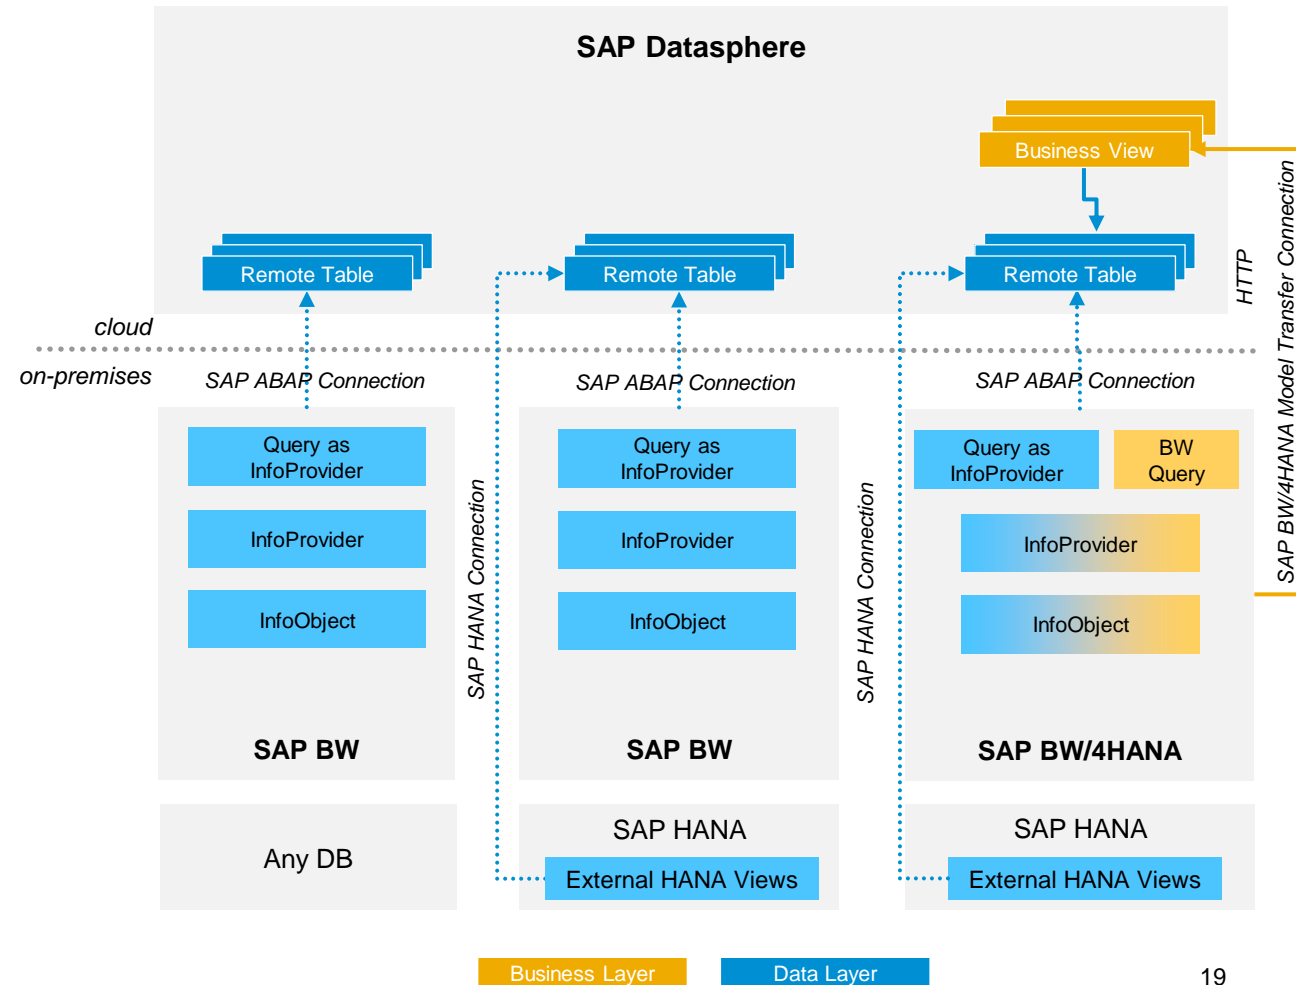

Understand what makes your SAP BW complex

SAP BW Query	(Non-ODP) Data sources	OpenHub destinations	Analysis Process Designer (APD)	Planning and Consolidation	Mixed modeling
OLAP Features SAP Datasphere is our semantic layer combining data from several sources & layers and covers the same functionality as OLAP queries. Many query features have already been implemented. Others have been identified and are listed as roadmap items.	FILE, HANA, Big Data sources SAP Datasphere provides many more data source types than SAP BW. All data sources that were available in SAP BW are equally available in SAP Datasphere. The focus of SAP BW bridge as a staging layer is on classic SAP connections (ODP_SAP).	Mass data export Open Hub destinations are not required in SAP Datasphere (and are not supported in SAP BW bridge) as it provides native export and data transport capabilities.	Analysis process modeling In SAP Datasphere you have the option to modernize the analysis process with a DataFlow artefact (manual). The conversion to SAP BW/4HANA supports APDs (DataFlow object)	SAP BPC and BCS (SEM-BCS) SAP BW add-ons are not supported in SAP Datasphere or SAP BW bridge. Strategically, the successor for SAP BCS is S/4HANA Group reporting. The successor for SAP BPC is SAP Analytics Cloud Planning (blog , web page). For SAP BW/4HANA, we support the consolidation add-on (SAP BCS4/HANA, see details) and SAP BCS aligned with the SAP S/4HANA maintenance strategy	Hybrid models SAP HANA on-prem is based on XS Classic, while the SAP HANA Cloud engine underlying SAP Datasphere is based on XS Advanced (XSA). Regarding the complexity and different kind of technologies, no migration option can be offered.

Connection options for SAP BW customers

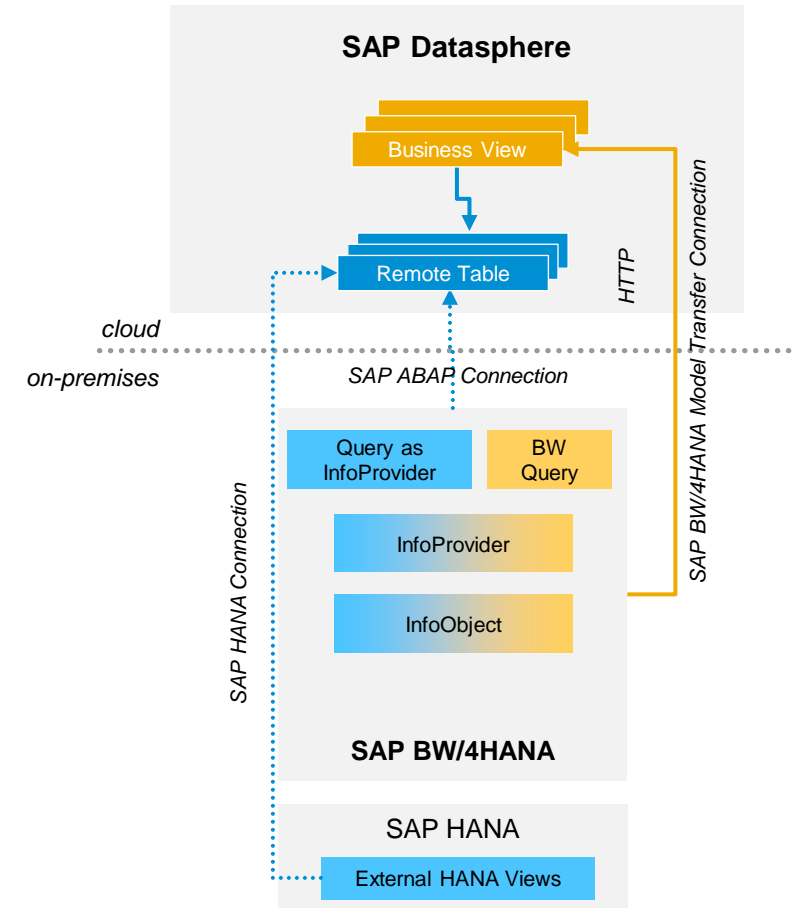

SAP BW Hybrid. Integration Overview

- Two different ways available for integrating SAP BW and SAP BW/4HANA systems:
 - Federated/replicated data consumption scenarios via
 - Operational Data Provisioning framework (SAP ABAP connection)
 - External SAP HANA Views (SAP HANA connection)
 - Federated/replicated business semantics integration scenarios via SAP BW/4HANA Model Transfer connection
- Differences in support of consumable entities, supported entity features, federated or replicated scenarios, location & usage of calculation engine
- Remote or replicated data consumption scenarios supported with SAP BW & SAP BW/4HANA
- Business semantics migration support for SAP BW/4HANA only via SAP BW/4HANA Model Transfer connection

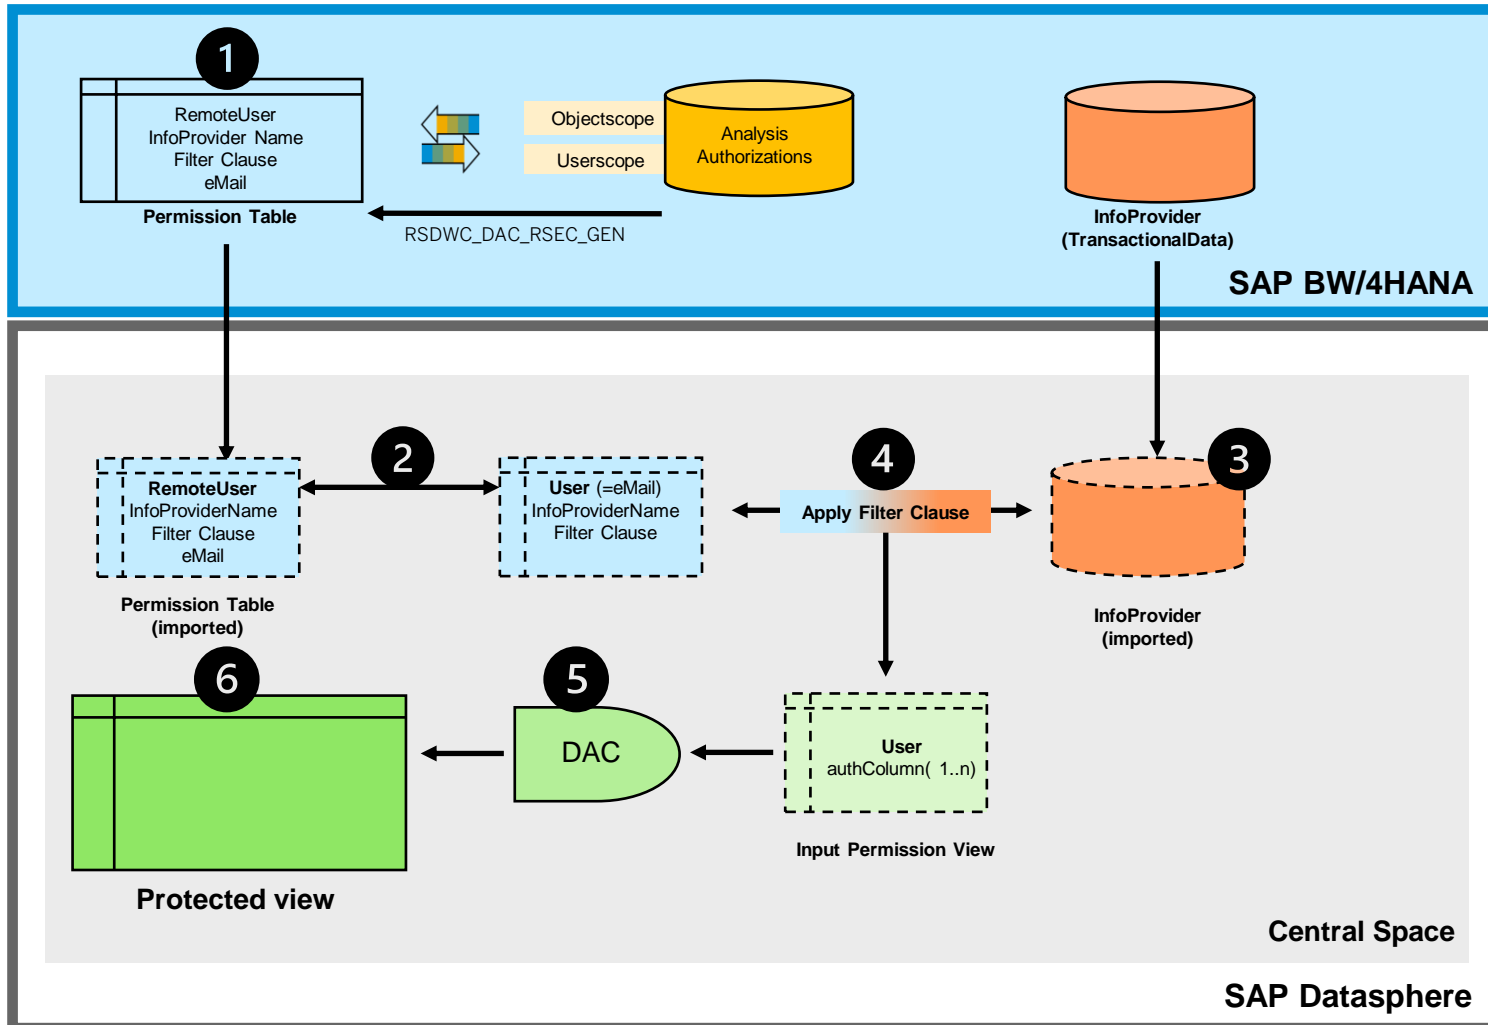

SAP BW Hybrid. SAP BW/4HANA Model Transfer

- Provide SAP BW/4HANA business semantics to SAP Datasphere
- Enable staging scenarios for SAP BW/4HANA data and virtual models
- Transfer BW Query as native entity (KPI, analytic model)
- Support BW Analysis Authorizations in SAP Datasphere
- Hierarchy Support (virtual, available via semantics, native SAP Datasphere dimension with hierarchies)*
- SAP BW/4HANA system only acts remote data source, calculation engine execution (via MDS) happens in SAP Datasphere
- More information about supported features in [SAP Note 2932647](#)

SAP Datasphere – Remote Authorizations

Leverage your SAP BW/4HANA authorization in SAP Datasphere

Process Flow:

1. For the given scope (User, InfoProvider) the Analysis Authorizations are exported in the Permission Table in SAP BW/4HANA (Transaction: RSDWC_DAC_RSEC_GEN; technical name of Permission Table: RSDWC_RSEC_DAC)
2. Permission Table is imported to SAP Datasphere and the (BW)Remote User is replaced by the Datasphere User which is the eMail by Standard, BAdI provided for other logic of replacement
3. SAP BW/4HANA InfoProvider must be imported into SAP Datasphere (via Data Builder) as well
4. An Input Permission View is generated by applying the Filter Clause (with a generated SQL Script)
5. Data Access Control is generated
6. Protected View from imported InfoProvider is generated with the Data Access Control assigned. This view can be shared to other Spaces.

Summary:

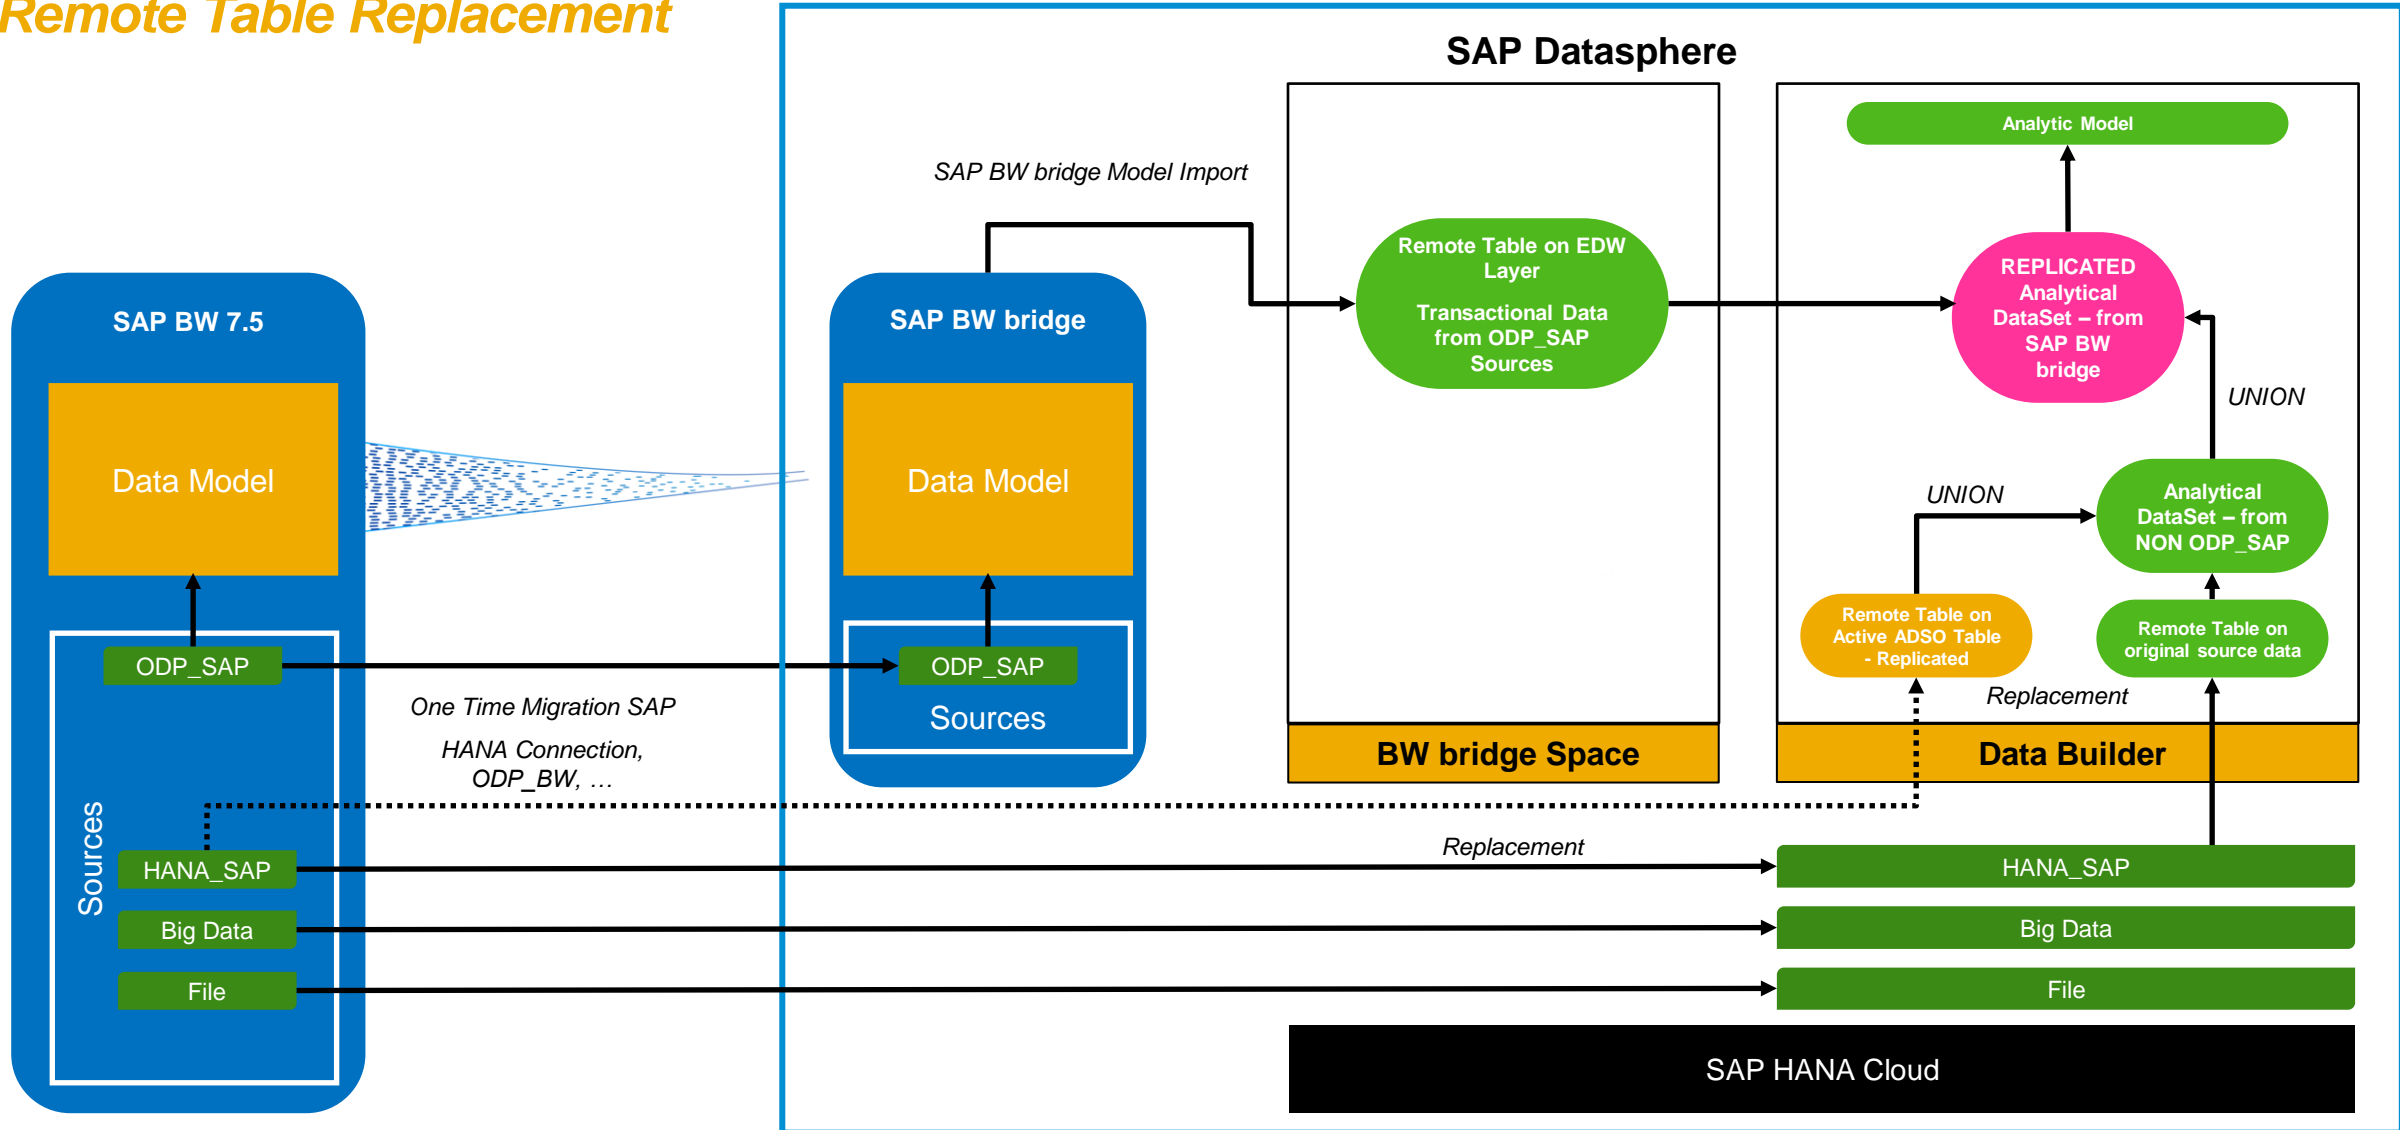

Three objects will be generated in SAP Datasphere for each Remote InfoProvider selected for protection:

- Data Access Control
- View of the SAP BW/4HANA InfoProvider protected by the Data Access Control
- SQL Script that exposes the permissions for each user based on the Analysis Authorizations from SAP BW/4HANA

Takeover Metadata & Historical Data for NON ODP_SAP data models

Takeover of Metadata & Historical Data for NON ODP_SAP Data models

Remote Table Replacement

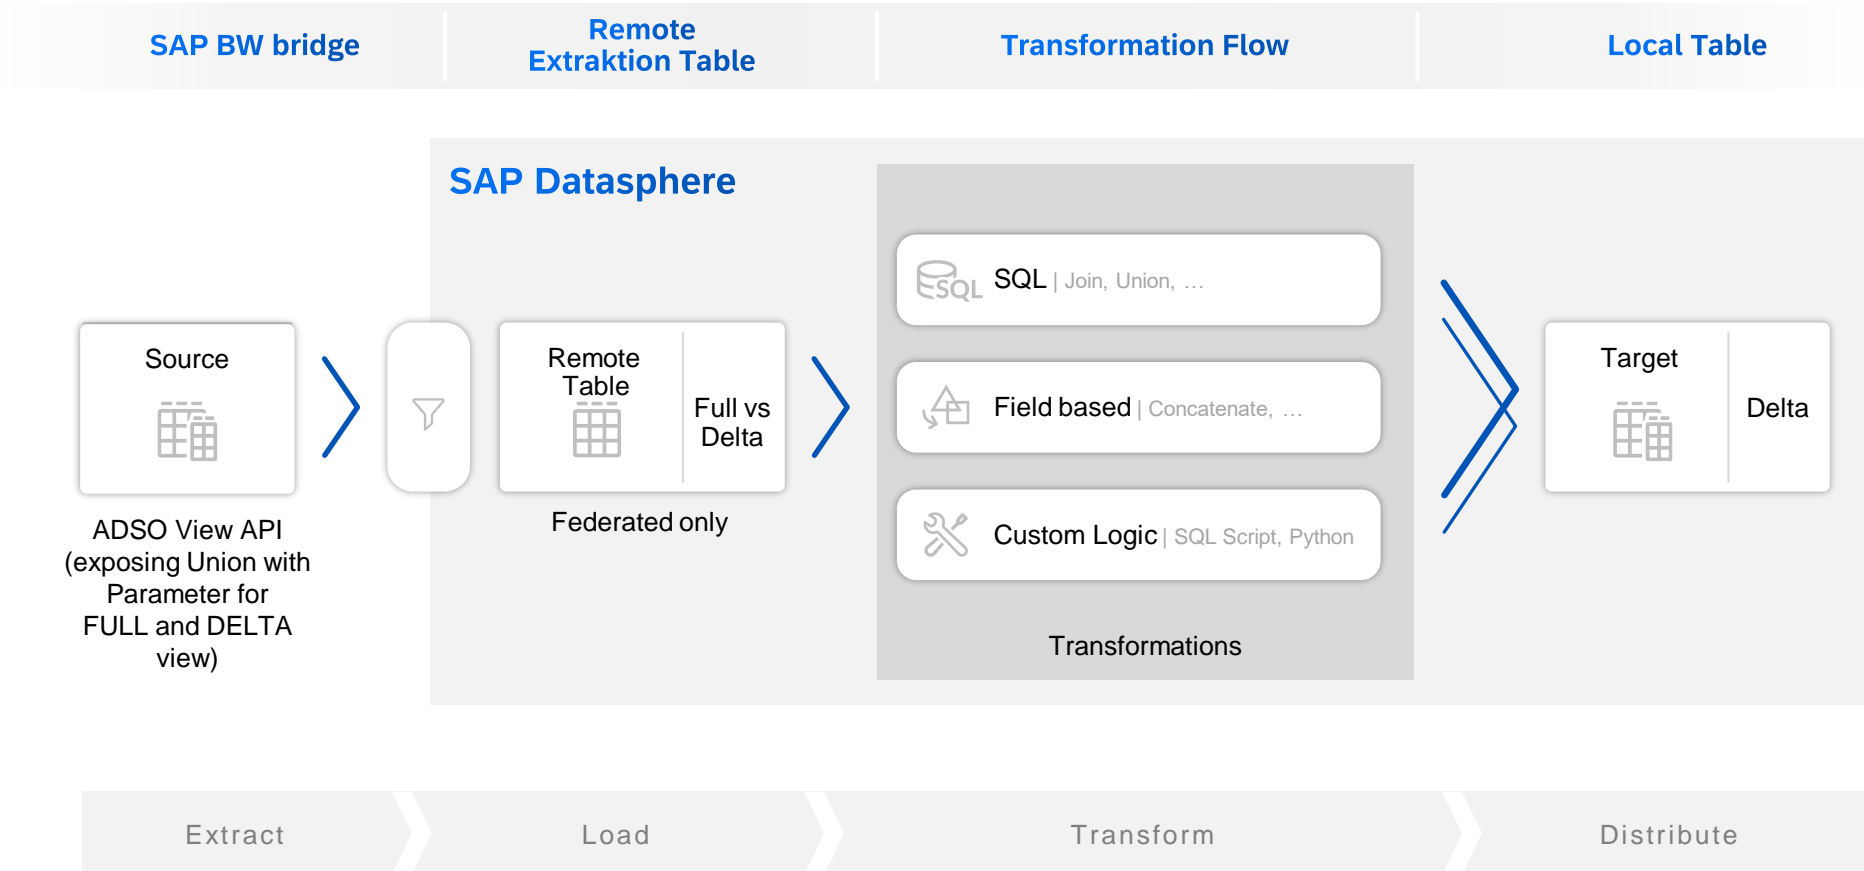

Transformation Flow – SAP BW bridge Delta

Replication Flow is intended to become our strategic replication technology

Delta enabled transformation for staging. Focused on SAP HANA transformations, allowing customer code extensions

Planned a light-weight Python exit. Extended scripting (libraries, testability, debugging) but still sandboxed.
